

Components are pre designed elements you can incorporate into your models. You can find landscaping, architectural, people, etc models to bring into your design.

Note: The use of components can slow down your computer, especially if you are using a lot of them. Recommended that

1. Open an existing SketchUp model or create a new one.
2. Select Window> components. A new window will appear.
3. Type the name for something you wish to search for in the search box. For this example we will find a tree.
4. Type 'tree' in the search box and press 'Enter'.
5. Scroll through the trees when you find one you like, double click it to place it onto your SketchUp model.

6. Select the tree using the select tool. 
7. Type 'S'. The bounding box turns yellow. Drag in to change the size of your object.
8. Place some landscaping around the dog house you created in the previous exercise and save into your working folder.
